Virology 188:102-113(1992).

-!- FUNCTION THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral postition, Cys or Thr in Pl and Ser or Ala in Pl'.

-!- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase;
Core protein; Coat protein; Envelope protein; Helicase; ATP-binding;
Transmembrane; Nonstructural protein; Hydrolase; Serine protease;
   Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae; Hepacivirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPPOTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROPEINS: PROPEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ΒY

HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
I- CAPALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in Pl and Ser or Ala in Pl'.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CELLULAR ANINOPEPTIDASE.

Kobe B., Delsenhofer J.;
A structural basis of the interactions between leucine-rich repeats and protein ligands.";
Nature 374:183-186(1995).
I-FUNCTION: INHIBITOR OF PANCREATIC RNASE AND ANGIOGENIN. MAY ALSO FUNCTION: INHIBITOR OF PANCREATIC RNASE AND THE STATES.
SUBUNIT: FORMS A TIGHT ONE-TO-ONE COMPLEX WITH THE RNASE.
SUBCELLULAR LOCATION: Cytoplasmic.
SIMILARITY: Contains 15 leucine-rich (LRR) repeats.
                               X-RAY CRYSTALLOGRAPHY (2.5 ANGSTROMS).

"Hepatitis C virus type V genome isolated from a patient in Germany.";
Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN BANELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
ROTEIN C AND MARA (BY SIMILARITY).

Science 277:570-574(1997).
-!- SUBGUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).
